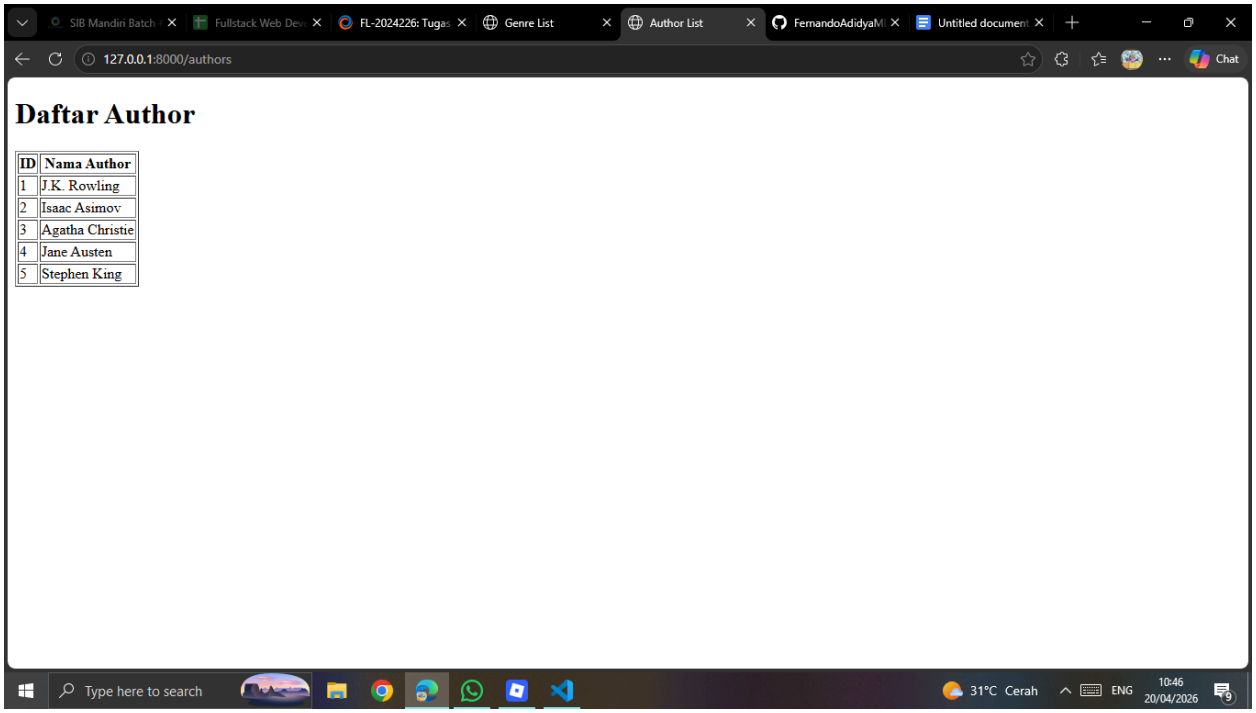
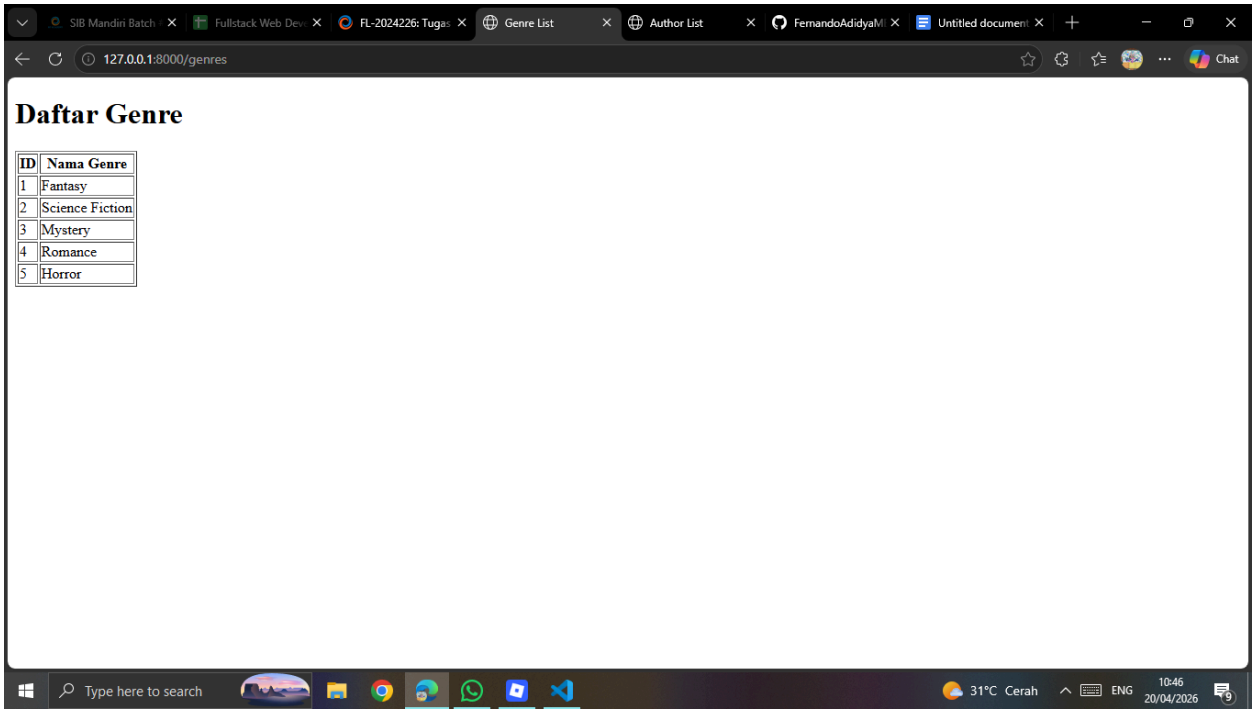
HASIL:





PENJELASAN

1. Routing

Saya menambahkan routing di file `routes/web.php`:

```
<?php

use Illuminate\Support\Facades\Route;
use App\Http\Controllers\GenreController;
use App\Http\Controllers\AuthorController;

Route::get('/genres', [GenreController::class, 'index']);
Route::get('/authors', [AuthorController::class, 'index']);
```

2. Controller

Saya membuat dua controller:

- **GenreController → memanggil data dari `Genre::getAll()` lalu mengirimkannya ke view `genres.index`.**
- **AuthorController → memanggil data dari `Author::getAll()` lalu mengirimkannya ke view `authors.index`.**

3. Model

Saya membuat dua model sederhana berupa array:

- **Genre.php berisi 5 data genre: Fantasy, Science Fiction, Mystery, Romance, Horror.**
- **Author.php berisi 5 data author: J.K. Rowling, Isaac Asimov, Agatha Christie, Jane Austen, Stephen King.**

Model ini menggunakan method `getAll()` untuk mengembalikan data array.

4. View

Saya membuat dua file Blade:

- **`resources/views/genres/index.blade.php` → menampilkan tabel daftar genre.**
- **`resources/views/authors/index.blade.php` → menampilkan tabel daftar author.**

Masing-masing view menampilkan data dalam bentuk tabel HTML dengan kolom ID dan Nama.

5. Testing
Php artisan serve

Kemudian saya buka browser:

- `http://127.0.0.1:8000/genres` → **tampil tabel Genre dengan 5 data.**
- `http://127.0.0.1:8000/authors` → **tampil tabel Author dengan 5 data.**

Source Code:

🧩 **1. File:** `routes/web.php`

```
<?php

use Illuminate\Support\Facades\Route;
use App\Http\Controllers\GenreController;
use App\Http\Controllers\AuthorController;

/*
|--------------------------------------------------------------------------
| Web Routes
|--------------------------------------------------------------------------
|
| Di sini saya mendaftarkan route web untuk aplikasi.
| Route ini akan dipanggil melalui browser.
|
*/

Route::get('/', function () {
    return view('welcome');
});

Route::get('/genres', [GenreController::class, 'index']);
Route::get('/authors', [AuthorController::class, 'index']);
```

🧠 2. File: app/Http/Controllers/GenreController.php

```php
<?php

namespace App\Http\Controllers;

use App\Models\Genre;

class GenreController extends Controller
{
    public function index()
    {
        $genres = Genre::getAll();
        return view('genres.index', compact('genres'));
    }
}
```

🧠 3. File: app/Http/Controllers/AuthorController.php

```php
<?php

namespace App\Http\Controllers;

use App\Models\Author;

class AuthorController extends Controller
{
    public function index()
    {
        $authors = Author::getAll();
        return view('authors.index', compact('authors'));
    }
}
```

📦 4. File: app/Models/Genre.php

```php
<?php

namespace App\Models;

class Genre
{
    public static function getAll()
    {
        return [
            ['id' => 1, 'name' => 'Fantasy'],
            ['id' => 2, 'name' => 'Science Fiction'],
            ['id' => 3, 'name' => 'Mystery'],
            ['id' => 4, 'name' => 'Romance'],
            ['id' => 5, 'name' => 'Horror'],
        ];
    }
}
```

📦 5. File: app/Models/Author.php

```php
<?php

namespace App\Models;

class Author
{
    public static function getAll()
    {
        return [
            ['id' => 1, 'name' => 'J.K. Rowling'],
            ['id' => 2, 'name' => 'Isaac Asimov'],
            ['id' => 3, 'name' => 'Agatha Christie'],
            ['id' => 4, 'name' => 'Jane Austen'],
            ['id' => 5, 'name' => 'Stephen King'],
        ];
```

```
    }
}
```

🖥️ 6. File: resources/views/genres/index.blade.php

```
<!DOCTYPE html>
<html>
<head>
    <title>Daftar Genre</title>
</head>
<body>
    <h1>Daftar Genre</h1>
    <table border="1">
        <tr>
            <th>ID</th>
            <th>Nama Genre</th>
        </tr>
        @foreach($genres as $genre)
        <tr>
            <td>{{ $genre['id'] }}</td>
            <td>{{ $genre['name'] }}</td>
        </tr>
        @endforeach
    </table>
</body>
</html>
```

🖥️ 7. File: resources/views/authors/index.blade.php

```
<!DOCTYPE html>
<html>
<head>
    <title>Daftar Author</title>
</head>
<body>
    <h1>Daftar Author</h1>
    <table border="1">
```

```
        <tr>
            <th>ID</th>
            <th>Nama Author</th>
        </tr>
        @foreach($authors as $author)
        <tr>
            <td>{{ $author['id'] }}</td>
            <td>{{ $author['name'] }}</td>
        </tr>
        @endforeach
    </table>
</body>
</html>
```

🚀 8. Cara Menjalankan

Php artisan serve

Buka browser:

- http://127.0.0.1:8000/genres → tampil tabel Genre.
- http://127.0.0.1:8000/authors → tampil tabel Author.

Saya telah membuat sistem MVC sederhana sesuai instruksi tugas:

- Model berisi data array (Genre & Author).
- Controller menghubungkan model ke view.
- View menampilkan data dalam tabel HTML.
- Routing mengatur URL /genres dan /authors.
- Testing dilakukan dengan php artisan serve dan hasil tampil sesuai.
- Repository GitHub sudah diupload dan siap disubmit ke LMS.
